Event-Alternative splicing; Named isoforms=1;

Comment=At least 216 isoforms may be produced by alternatively spliced extracellular domains at sites 1 to 5, each consisting of modular sequences (A-C) that seem to be used independently.

Additional isoforms may derive from a minor cytoplasmic splice is site 6. Beta isoforms and extractive from a minor cytoplasmic splice.

Commentatively spliced domains at sites 4, 5 and 6;

Isoid=063374-1; Sequence=Displayed;

Commentatively spliced domains at sites 4, 5 and 6;

C. C. FUNCTION: Neuronal cell surface protein that may be involved in cell recognition and cell adhesion. May mediate intracellular CC signaling.

C. SUBDNIT: The laminin G-like domain 1 binds to neurexophilin 1.

C. Isoforms alpha 2C bind to alpha-dystroglycan.

C. ISOFORMATIVE RODUCTS:

C. SUBUNIT: The laminin G-like domain 1 binds to neurexophilin 1.

C. SUBUNIT: The laminin G-like domain 2 binds to neurexophilin 1.

C. SUBUNIT: The laminin G-like domain 1 binds to neurexophilin 1.

C. LATERNATIVE RODUCTS:

C. SUBUNIT: A LOCATION: Type I membrane protein (Potential).

C. LATERNATIVE PRODUCTS:

C. LATERNATIVE PRODUCTS:

C. SUBUNIT: A supplication of alternative promoters.

C. SUBUNIT: A supplication of alternative promoters.

C. L. SUBUNIT: A LOCATION: Type isoforms in their Netraniuus;

C. L. SUBUNIT: A LOCATION: A location of alternative branchines.

C. L. SUBUNIT: A location of a location of

-!-'FUNCTION: Neuronal cell surface protein that may be involved in
cell recognition and cell adhesion. May mediate intracellular
                                           signaling.
--- SUBMIT: The laminin G-like domain 1 binds to neurexophilin 1.
Specific isoforms bind to alpha-dystroglycan (By similarity).
--- SUBMININE ROCATION: Type I membrane protein (Potential).
--- ALTERNATIVE PRODUCTS:

Event-Alternative promoter;

Comment-A number of isoforms, alpha-type (shown here) and beta-type (AC PS8401), are produced by use of alternative promoters. Beta-type isoforms differ from alpha-type isoforms in their N-terminus;
                                                                                                                                                                                                                                          PROSITE; PSO10022, EGF 1; FALSE_NEG.

The cytoplasmic C-terminal region binds to CASK. Laminin domain 2 binds to NXPH1. Specific isoforms bind to alpha-lyon and to alpha-latroxin. Binds SYTL1 (By similarity). ULAR LOCATION: Type I membrane protein (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            lternative promoter;
nt=A number of isoforms are produced by use of alternative
ters. The alpha and beta (AC P58400) isoforms differ in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Event-Alternative splicing; Named isoforms=12; Comment-Additional isoforms seem to exist. There is probably comment-Additional isoforms seem to exist. There is probably more than 96 isoforms. There is a combination of five more attentively spliced domains at sites 1 to 5, each consisting of modular sequences (A-G) that seem to be used independently. For splice site 1 additional splice modules might be possible thus increasing the number of possible isoforms. Beta isoforms (AC Q28142) share the combination of two alternatively spliced domains at sites 4 and 5. Experimental confirmation may be lacking for some isoforms.
                                                                                                                                                                           "Structure and evolution of neurexophilin.",
J. Neurosci. 16:4360-4369(1996).

-!- PUNCTION. Neuronal cell surface protein that may be involved in cell recognition and cell adhesion. May mediate intracellular signaling.

-!- SUBUNIT: The cytoplasmic C-terminal region binds to CASK. Binds SYTLI. Laminin G-like domain 2 binds to NXPHI. Isoforms 9 and alpha-4c bind to alpha-dystroglycan. Isoform alpha-4c binds to alpha-dystroglycan. Isoform alpha-4c binds to alpha-torxin (By similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).
  and expressed in distinct subsets of neurons.";

Comment-At least 96 isoforms may be produced by alternative Comment-At least 96 isoforms may be produced by alternative splicing. There is a combination of five alternatively spliced domains at sites 1 to 5, each consisting of modular sequences (A-G) that seem to be used independently. For splice site 1 additional splice modules might be possible thus increasing the number of possible isoforms. Beta-type isoforms (AC Q63373) share the combination of two alternatively spliced domains at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -!- SUBUNIT: Binds SYTLI (By similarity). The cytoplasmic C-terminal region binds to CASK, Laminin G-like domain 2 binds to NXPH1 and NXPH3. Isoforms alpha 2C and alpha 4C bind to alpha-dystroglycan. Isoforms alpha 4C bind to alpha-latroxin.
-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).

An assay for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis comprising detecting an isomerized or optically inverted protein in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an assay for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The assay involves measuring (in a biological sample) the amount or presence of an isomerised or optically inverted protein or one or more isomerised or optically inverted fragments from proteins such as perlecan, biglycan, decorni, fibrillin-1 or protocadherin. The assay is useful for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The present sequence is human perlecan protein
                                                                                                                             Human; diagnosis; ostecarthritis; rheumatoid arthritis; perlecan.
                                                                                                                                                                                                                                                                                                                                                              Cloos PAC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        241 VTTPSLSGAGSYLALPALTNTHHELRLDVEFKPLAPDGVLLFSGGKSGPVEDFVSLAMVG 300
                                                                                                                                                                                                                                                                                                                                                                                    method of the invention. The specification describes a method which uses at least one polyupeptide or polyuclectide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GMZ activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The protein polynuclectides and polypeptides are used for diagnosis, proyention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1869 YVCVCPAGFIGSRCEHSQALHCHPEACGPDAICVARPDGRGYICRCHLGRSGLRCEEGVI

                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cerivity of (II) auseful in gene therapy techniques to restore normal cerivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food of sites expressing (II). (I) and (II) are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving abbrrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics forensics, gene mapping, identification of mutations in and to produce other types of data and products dependent on DNA and amino acid sequences. Abgonolo-Abd30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in the control of the printed specification.

The present sequence represents a human polypeptide, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymolectide sequence belonging to the parselecan, precursor of the retinol-binding plasma protein, precursor of the retinol-binding plasma protein, precursor of familias. The method is used for detecting, preventing or treating a familias. The method is used for detecting, preventing or treating a polymolectides and polypeptides are used for diagnosis, prognosis, polymolectides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including uses as vaccines and in gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GRSPGPNVAVNAKGSVYIGGAPDVATLTGGRFSSGITGCVKNLVLHSARPGAPPPQPLDL 690

The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onest or course of VD, especially detecting in a sample of cerebrospinal fluid (GSF) from the subject one of 223 VD-associated protein isoforms (VPIS) (ABB55801-ABB56255) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognesis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      VD; VD-associated protein isoform; VPI; screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                    Screening, diagnosis or prognosis of vascular dementia (VD), useful determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of eathers containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of correlates with the presence, by, especially detecting in a sample of correlates with Albabas (DSP) from the subject one of 223 VD-associated correcting in a sample of correlation. Detecting VD-associated features and VPI is useful for the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIs) (ABB5801-ABB56025) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or the effect of therapy administered to a subject at risk of VD. For monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhibiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vascular Dementia; VD; VD-associated protein isoform; VPI; screening;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or
                                                                                                                   The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onset or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIS) (ABB55801-ABB56285) as fully defined in the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or inhabiting the function of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Dementia; VD; VD-associated protein isoform; VPI; screening;

The invention relates to screening, diagnosis or prognosis of Vascular Dementia (VD) in a subject comprising analysing body fluid from the subject by 2-dimensional (2-D) electrophoresis to generate a 2-D array of features containing at least one chosen feature whose relative abundance correlates with the presence, absence, stage or severity of VD or predicts the onest or course of VD, especially detecting in a sample of cerebrospinal fluid (CSF) from the subject one of 223 VD-associated protein isoforms (VPIs) (ABB55801-ABB56295) as fully defined in the specification. Detecting VD-associated features and VPI is useful for the screening, diagnosis or prognosis of VD, for determining the stage or severity of VD, for identifying a subject at risk of VD or for monitoring the effect of therapy administered to a subject having VD. Nucleic acids encoding a VPI or identification of a VPI are useful for the treatment of VD and for gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Screening, diagnosis or prognosis of vascular dementia (VD), useful for determining stage of VD and monitoring the effect of VD therapy, comprises analyzing body fluid by 2-dimensional electrophoresis for features correlated with VD.
                                                                                                                                                                                                                                                                                                                                                                                                                    Vascular Dementia, VD; VD-associated protein isoform; VPI; screening; diagnosis; prognosis; gene therapy.

The invention relates to an isolated polymucleotide (ACF64435-ACF64733)

conciding a Propionibacterium acnes protein. The invention also relates to encoding a propionibacterium acnes protein. The invention also relates to immunogenic fragments of P. acnes polymeptides. The invention additionally encompasses expression vectors and host cells comprising a comprision adjusted rivention, adjusted rivention, antibodies against polymeptides of the invention invention invention invention invention invention and isolated T cell population of the invention; a comprision a protein composition (comprising P. acnes polymeptides, polymeptide, antibodies, fusion proteins, T cell populations, or polymeptide, antibodies, fusion proteins, T cell populations, or contingent of partient; and method for inhibiting the development of P. acnes in a contingent present of or attigention in a method for inhibiting the development of P. acnes in a parient; and method for inhibiting the development of P. acnes in a parient; and method for inhibiting the development of P. acnes in a parient; or for stimulating an immune response specific for a P. acnes the polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymeptides, polymenting cells that express the polymeles are useful for diagnosing, preventing or treating acnes protein. The polymucleotides can also be used as probes or primers for nucleic acid hybridisation. The vaccine composition is useful for the extraming a diagnostic assay. The present content of thought to contain an immune are polyment of an immune septomes against processing and the kit is useful for performing a diagnostic assay. The present for thought to contain an immune and encounted and present of thought to contain an immune and encounted and present of thought to contain an immune and encounted and appear and the polyment for the polyment of the polyment of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New Propionibacterium acmes polypeptides and polymucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acme vulgaris, or for stimulating an immune response specific for a P. acmes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```

The invention discloses a composition comprising two or more isolated rate or human polymuclectides or a polymuclectide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the novel polymuclectide, a host cell comprising the vector, a method for identifying a nuclectide sequence which is differentially regulated in an animal subjected to pain and a hat increases or decreases the expression of the polymuclectide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymuclectide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating specification, a method for identifying a compound useful in treating continuity in an animal of one or more of the regulates the activity in an animal of one or more of the specification, a method for identifying a compound useful in treating conjugates its activity is useful for preparing a medicament for treating collustry (Ctil) and spared nerve injury (Ctil) and spared nerve injury (Stil) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed the sequence data so this patent did not form part of the printed the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of the form of t ftp.wipo.int/pub/published_pct_sequences

```
The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a comprising the vector of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal composition and a polynucleotide sequence which is differentially expressed in neuronal tissue of a first animal composition and the expression of a polynucleotide sequence which is differentially expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a compound that regulates the activity of one or more of the regulates the expression of a polynucleotides, a method for producing a pharmaceutical composition or more of the polynucleotides in an animal of one or more of the polynoptides of the polynoptides of the polynucleotide or the compound that expecification, a method for identifying a compound useful in treating condulates its activity is useful for preparing a medicament for treating modulates its activity is useful for preparing a medicament for treating conjugations or their antibodies. The polynucleotide or the compound that (ci) and spared nerve injury (Chung), chronic constriction continued become presented is a rat protein (shown in Table 2 of the rapport of the specification) which is differentially expressed during pain. Note:

The invention discloses a composition comprising two or more isolated rate or human polynuclectides or a polynuclectide which represents a fragment, claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nuclectide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynuclectide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynuclectide sequence which is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynuclectides, method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more or more compound that modulates its activity is useful for preparing a medicament for treating modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction
                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the cativity in an animal of one or more of the cativity in the activity in the polypeptides given in the specification, a method for identifying a compound useful in treating
                                                                                                                                                                                                                                                                    ö
injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence adta for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                    Gaps

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insectiolates, therapeutical and pharmaceutical faruge. The invention discloses genomic DNA sequences (ABLi16.176-ABL30511), expressed DNA sequences (ABL16.176-ABL30511), expressed DNA sequences (ABL16.175) and the encoded proteins (ABB57737-BB130737). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                 pain and a pharmaceutical composition comprising the one or more poin and a pharmaceutical composition comprising the polygoticatides or their antibodies. The polygoticatide or the compound that modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Description
